

ROBOTICS PITCH · 2026

JengaBot

*The arm that **BUILDS** the tower —
so humans can finally just **play**.*

Sameer · Volk · Bruce · Jonathan

A returning team. A new obsession.

Setting up Jenga is the worst part of Jenga.

It's tedious

54 blocks. 18 layers. Three at a time. Rotated 90° each row. Every single time.

It's fragile

One wobble and you're back to square one — before anyone has even taken a turn.

Nobody's volunteering

It's the chore that gates the fun. The host always gets stuck with the build.

An arm that **builds** the Jenga tower.

Note: not play it. Build it. We solve the boring half so humans get the fun half.

IN P U T

54 loose blocks

Sees the blocks

Vision-driven pose estimation of every loose block on the table.

Plans the stack

Layer-by-layer placement plan with alternating 90° rotation.

Places with care

Compliant grasp + slow descent — no collapsing mid-build.

We don't just dream. We win.

Three past hackathon wins, three different robotics platforms. We've shipped real systems before — under pressure, on a deadline.

Carmello's Canine

Q u a d r u p e d b e h a v i o r

Won with a dog-inspired robotic companion — gait, interaction, and personality.

Unitree Go2

Q u a d r u p e d p l a t f o r m

Took home a win driving the Go2 — perception, locomotion, and crowd-pleasing tricks.

reBot · Seeed Studio

R o b o t i c a r m p l a t f o r m

Won on Seeed's reBot — arm control, task planning, and a clean live demo.

The full crew. All four seats filled.

Sameer

Team Lead

Pitch, planning, and pulling the whole thing across the finish line.

Volk

Returning
Member

Veteran of past wins. Bringing the muscle memory and the calm.

Bruce

Returning
Member

Won with us before. Knows the platforms, knows the rhythm.

Jonathan

New Member

Our newest signing — fresh energy to round out the squad.

Three loops, one tower.

01

Perception

Detect every loose block on the table — pose, orientation, occlusion-aware.

02

Planning

Compute layer-by-layer placement: 3 blocks, alternating 90° rotation, 18 layers.

03

Manipulation

Pick → align → place. Gentle descent. Detect mis-stacks and self-correct.

From first pick to full tower.

Hour 1

Day 1 PM

Day 2 AM

Demo

Pick one block

Stack a layer

Five layers

**Full 18-layer
tower**

Vision + grasp on a single piece.

3 blocks, aligned, on a known base.

Alternating rotation, repeatable.

From scratch, on the clock.

Real hardware. Real blocks. Two days, four checkpoints — so the demo doesn't depend on demo-day luck.

If the tower goes up early, we keep going.

Speed run

Stopwatch on the build. Iterate until we're faster than a human.

Messy starts

Blocks dumped anywhere — no neat trays. Pure vision-driven sort + stack.

Reset & re-stack

When the game ends, the arm clears the table and rebuilds. Game-loop, hands-free.

Crowd mode

Audience picks where blocks land. Arm adapts the plan live.

Three wins. Three platforms. One *obsession*.

Setting up Jenga is frustrating. So we're building the arm that does it — and we're the team to ship it.

Let's build.
